CSC Session Results and Evidence Profiles for AI Systems

Results from Q-Pathformer Enterprise (v1.0)

Document Control Information

Document Identifier: APOD-TR-009-R

Edition: First Edition
Date of Issue: 16 April 2026
Status: Public Review Draft (Standards Exploration)

Author: Anthony Siljeg
Affiliation: Alnotrea Labs / Policy of Developments - Access PoD *Initiative*

1. Active v1.0 CSC Session Results

1.1 Purpose

This document records the **normalized CSC session outputs** for the v1.0 enterprise release.

It provides:

- session-scoped CSC results,
- factor-level interpretation summaries,
- observed metric coverage,
- and release-bound interpretation constraints.

This document is **descriptive and evidence-bound**.
It does not redefine CSC scoring, governance authority, or lifecycle semantics.

1.2 Active Result Set Overview

Profile	Role	Generation Path	Composite Score	CSC Level	Observed Metrics	Coverage
Finance	Active baseline	mapper-driven	91.9	5	16 / 60	0.2667
Healthcare	Active baseline	mapper-driven	84.6	4	12 / 60	0.20
Public	Active example	curated	93.0	5	12 / 60	0.20
AI / Emerging-Tech	Active example	curated	82.9	4	12 / 60	0.20

1.3 Finance — Primary Enterprise Baseline

Composite Score: 91.9
CSC Level: 5
Observed Metrics: 16 / 60
Coverage: 0.2667

Interpretation:

- strongest mapper-driven baseline in the release
- includes repaired grouped_sparse_e64 execution pathway
- highest evidence density across active profiles
- governance-chain factors exhibit **provisional saturation** rather than full maturity

---

1.4 Healthcare — Conservative Enterprise Baseline

Composite Score: 84.6
CSC Level: 4
Observed Metrics: 12 / 60
Coverage: 0.20

Interpretation:

- conservative sector baseline
- lower saturation across factors
- reflects constraint-driven governance interpretation
- demonstrates that CSC is not optimized for maximum scoring

1.5 Public — Curated Standards Example

Composite Score: 93.0
CSC Level: 5
Observed Metrics: 12 / 60
Coverage: 0.20

Interpretation:

- curated and normalized standards-facing example
- stable factor distribution
- not derived from mapper-driven lifecycle pathway
- not equivalent to enterprise baselines for comparison

1.6 AI / Emerging-Tech — Forward-Looking Example

Composite Score: 82.9
CSC Level: 4
Observed Metrics: 12 / 60
Coverage: 0.20

Key Constraint:

- sector trust factor (f6.6) materially lower
- sector_validation_met = false

Interpretation:

- valid but immature sector profile
- reflects emerging-domain uncertainty
- demonstrates limits of current sector modeling

1.7 Key Result Insight

The highest-scoring CSC outputs in this release occur where:

- mapper-driven lifecycle evidence exists
- execution telemetry is densest
- governance-chain artifacts are complete

1.8 CSC Artifact Structure (Release Format)

All CSC outputs in the v1.0 release are emitted as paired artifacts:

- **JSON record** — machine-readable source-of-record for scoring output (non-authoritative)
- **Markdown (.md)** — human-readable interpretation

Generated Artifact Structure

```
/generated/
  /reports/
    <session>.csc_report.json
    <session>.csc_report.md

  /certificates/
    <session>.csc_certificate.json
    <session>.csc_certificate.md

  /metric_observation_drafts/
    <profile>_metrics.json

  /evidence_input_drafts/
    <profile>_evidence.json
```

Interpretation Rule:

- JSON = authoritative scoring record
- Markdown = structured human interpretation

---

2. Research and Comparative History

2.1 Purpose

This section preserves prior runs as:

- methodological development artifacts
- calibration references
- non-release baseline history

These results are **not part of the active v1.0 release set**.

2.2 Finance Research History

Pre-repair baseline:

- Composite Score: 87.6
- CSC Level: 3

Scenario experiments:

- ~93–94 range
- CSC Level: 5

Reading:

- scenario weighting viable
- baseline retained for stability
- replaced by repaired execution baseline

2.3 Healthcare Research History

Tightened baseline:

- Composite Score: 80.3
- CSC Level: 4

Reading:

- scenario variation produced limited differentiation
- sector constrained by evidence depth
- current baseline reflects improved realism

2.4 AI / Emerging-Tech Research Path

Mapper-driven rerun:

- Composite Score: 95.3
- CSC Level: 1
- telemetry_minimum_met = false

Reading:

- method viable
- gating correctly blocks promotion
- retained as research path only

2.5 Interpretation of Research Section

Research results demonstrate system capability and evolution,
but are not used as release-facing CSC outputs.

---

3. Current Interpretation and Next Development Path

3.1 Current System Reading

The v1.0 release should be interpreted as:

- a normalized active CSC set
- a mixed-maturity system
- not a fully uniform or complete model

3.2 Structural Truth of the Release

- Finance = strongest enterprise baseline
- Healthcare = conservative baseline
- Public = curated standards example
- AI / emerging-tech = exploratory example

3.3 Critical Boundary

CSC session outputs in this release are grounded in:

Path 2 — Access-Mode lifecycle pathway

- Path 1 → training reference
- Path 3 → onboarding only
- Path 2 — primary CSC evidence source in this release

3.4 Key Limitations Reflected in Results

- sparse metric coverage (12–16 / 60)
- proxy-derived evidence remains significant
- uneven sector maturity
- limited scenario generalization

3.5 Next Development Priorities

1. expand Layer 1 telemetry (execution depth)
2. reduce proxy dependence

3. normalize sector pipelines
4. strengthen confidence integration
5. increase observed metric coverage

3.6 Final Release Reading

The v1.0 results demonstrate:

- a functioning CSC assurance system
- grounded in execution-bound evidence
- constrained by current telemetry limits
- and evolving toward increased evidence maturity and coverage.
